

**Figure 4. Leukemia incidence vs. age.** Chemotherapy associates with AML more than radiation and may even suppress radiation associated CML. Comparing red vs. light blue curves at younger ages, germline associations may exist between 1<sup>st</sup> cancers and AML more than ALL. 1<sup>st</sup> cancer sites were breast, melanoma, lung, thyroid, cervix, brain and testes. Ages were shifted by plus or minus 1 or 2 years to improve confidence interval visibility (see script).
